

Lesson 10

Definite Integrals

10A

- Area and Antiderivatives

Derivative of Area

Let the area of ABQP be $S(x)$

When x increases by h ,
the area increases by

$$dS = S(x+h) - S(x) \approx hf(x)$$

Derivative of $S(x)$

$$\frac{dS}{dx} = \lim_{h \rightarrow 0} \frac{S(x+h) - S(x)}{h} \approx f(x)$$

$$S'(x) = f(x)$$

Area function $S(x)$ is one of antiderivatives of $f(x)$.

Area and Indefinite integral

Let $F(x)$ be an arbitrary antiderivative.

$$S(x) = F(x) + C$$

From the definition $S(a) = 0$ at $x = a$

$$\therefore 0 = F(a) + C \quad \therefore C = -F(a)$$

Therefore $S(x) = F(x) - F(a)$

When $x = b$, the area is given by

$$S = F(b) - F(a)$$

Definite Integral

$F(b) - F(a)$ is called **the definite integral** of $f(x)$ over $[a, b]$

and written by $\int_a^b f(x) dx$ or $\left[F(x) \right]_a^b$

Definite integral

$$\int_a^b f(x) dx = \left[F(x) \right]_a^b = F(b) - F(a)$$

Since

$$\begin{aligned} \left[F(x) + C \right]_a^b &= \{F(b) + C\} - \{F(a) + C\} \\ &= F(b) - F(a) \\ &= \left[F(x) \right]_a^b \end{aligned}$$

$F(x)$ is an arbitrary antiderivative.

Properties of Definite Integrals

Linearity of the definite integrals

$$(1) \quad \int_a^b kf(x)dx = k \int_a^b f(x)dx$$

$$(2) \quad \int_a^b \{f(x) + g(x)\}dx = \int_a^b f(x)dx + \int_a^b g(x)dx$$

Reversing the integration

$$(3) \quad \int_b^a f(x)dx = -\int_a^b f(x)dx$$

Additivity for adjacent integrals

$$(4) \quad \int_a^b f(x)dx = \int_a^c f(x)dx + \int_c^b f(x)dx$$

Example

Examples 13-1 Find the following definite integral

$$\int_{-2}^4 (x^2 - 3x + 1) dx$$

Ans.

$$\begin{aligned}\int_{-2}^4 (x^2 - 3x + 1) dx &= \int_{-2}^4 x^2 dx - 3 \int_{-2}^4 x dx + \int_{-2}^4 dx \\ &= \left[\frac{x^3}{3} \right]_{-2}^4 - 3 \left[\frac{x^2}{2} \right]_{-2}^4 + [x]_{-2}^4 \\ &= \frac{4^3 - (-2)^3}{3} - \frac{3\{4^2 - (-2)^2\}}{2} + \{4 - (-2)\} \\ &= 12\end{aligned}$$

Example

Examples 13-2 Find the following definite integrals.

$$(1) \int_{-1}^3 x \, dx - \int_{-1}^1 x \, dx \qquad (2) \int_0^{\frac{\pi}{2}} \sin 2\theta \, d\theta$$

Ans.

$$\begin{aligned} (1) \int_{-1}^3 x \, dx - \int_{-1}^1 x \, dx &= \int_{-1}^3 x \, dx + \int_1^{-1} x \, dx \\ &= \int_1^3 x \, dx = \left[\frac{x^2}{2} \right]_1^3 = 4 \end{aligned}$$

$$(2) \int_0^{\frac{\pi}{2}} \sin 2\theta \, d\theta = \left[\frac{-\cos 2\theta}{2} \right]_0^{\frac{\pi}{2}} = \frac{-(-1)}{2} - \frac{(-1)}{2} = 1$$

Exercises

Ex.10-1 Find the following definite integral.

$$\int_0^1 (x^2 - x) dx + \int_1^3 (x^2 - x) dx$$

Ans.

Pause the video and solve by yourself.

Answer to the Exercises

Ex.10-1 Find the following definite integrals

$$\int_0^1 (x^2 - x) dx + \int_1^3 (x^2 - x) dx$$

Ans.

$$\begin{aligned} \int_0^1 (x^2 - x) dx + \int_1^3 (x^2 - x) dx &= \int_0^3 (x^2 - x) dx \\ &= \left[\frac{x^3}{3} - \frac{x^2}{2} \right]_0^3 = \frac{9}{2} \end{aligned}$$

Lesson 10

Definite Integrals (1)

10B

- Integration by substitution
- Integration by parts

Integration by Substitution

Integration by Substitution (1)

For the function $x = g(t)$

If $a = g(\alpha)$ and $b = g(\beta)$

then
$$\int_a^b f(x)dx = \int_{\alpha}^{\beta} f(g(t))g'(t)dt$$

Integration by Substitution (2)

If $\alpha = u(a)$ and $\beta = u(b)$

then
$$\int_a^b f(u(x))u'(x)dx = \int_{\alpha}^{\beta} f(u)du$$

Example

[Examples 13-4] Find the following definite integral by putting $2x+1 = t$

$$\int_0^1 (2x+1)^3 dx$$

Ans.

Put $2x+1 = t$

Then $x = \frac{t-1}{2}, dx = \frac{1}{2} dt$

x	$0 \longrightarrow 1$
t	$1 \longrightarrow 3$

Therefore

$$\int_0^1 (2x+1)^3 dx = \int_1^3 t^3 \cdot \frac{1}{2} dt = \frac{1}{2} \int_1^3 t^3 dt = \frac{1}{2} \left[\frac{t^4}{4} \right]_1^3 = 10$$

Example

Examples 10-5 Evaluate the following integral

$$\int_0^2 x^2 \sqrt{x^3 + 1} dx$$

Ans.

We put $u = x^3 + 1$, then $du = 3x^2 dx$

Therefore,

$$\int_0^2 x^2 \sqrt{x^3 + 1} dx = \int_1^9 \sqrt{u} \left(\frac{1}{3} du \right) = \frac{1}{3} \int_1^9 u^{\frac{1}{2}} du = \frac{1}{3} \left[\frac{2}{3} u^{\frac{3}{2}} \right]_1^9 = \frac{52}{9}$$

Integration by Parts

We learned

$$\int f(x)g'(x)dx = f(x)g(x) - \int f'(x)g(x)dx$$

In the case of definite integral

$$\int_a^b f(x)g'(x)dx = [f(x)g(x)]_a^b - \int_a^b f'(x)g(x)dx$$

Example

$$\begin{aligned} \int_0^{\frac{\pi}{2}} x \cos x dx &= \int_0^{\frac{\pi}{2}} x(\sin x)' dx = [x \sin x]_0^{\frac{\pi}{2}} - \int_0^{\frac{\pi}{2}} (x)' \sin x dx \\ &= \frac{\pi}{2} - \int_0^{\frac{\pi}{2}} \sin x dx = \frac{\pi}{2} - [-\cos x]_0^{\frac{\pi}{2}} = \frac{\pi}{2} - 1 \end{aligned}$$

Note: In the original image, a red box labeled $f(x)$ is connected to the x term, a blue box labeled $g'(x)$ is connected to the $\cos x$ term, and another blue box labeled $g(x)$ is connected to the $\sin x$ term in the second integral.

Exercises

Ex.13-2 Find the following definite integrals

$$\int_{-3}^{-1} \frac{dx}{(2x+1)^3}$$

Ans.

Pause the video and solve by yourself.

Exercises

Ex.13-2 Find the following definite integrals

$$\int_{-3}^{-1} \frac{dx}{(2x+1)^3}$$

Ans. We can solve this as follows. Put $2x + 1 = t$

then $x = \frac{t-1}{2}, \quad dx = \frac{1}{2} dt$

The new limits of integration are

$$t(-3) = -5 \quad \text{and} \quad t(-1) = -1$$

Therefore,

$$\int_{-3}^{-1} \frac{dx}{(2x+1)^3} = \int_{-5}^{-1} t^{-3} \cdot \frac{1}{2} dt = \frac{1}{2} \int_{-5}^{-1} t^{-3} dt = \frac{1}{2} \left[\frac{t^{-2}}{-2} \right]_{-5}^{-1} = -\frac{6}{25}$$

Ex.13-3 Find the following definite integrals

$$\int_0^2 x^2 e^x dx$$

Ans.

Pause the video and solve by yourself

Ex.13-3 Find the following definite integrals

$$\int_0^2 x^2 e^x dx$$

Ans.

In this exercise, we apply the formula twice as follows.

$$\begin{aligned} \int_0^2 x^2 e^x dx &= \left[x^2 e^x \right]_0^2 - \int_0^2 2x e^x dx = 4e^2 - 2 \left(\left[x e^x \right]_0^2 - \int_0^2 e^x dx \right) \\ &= 4e^2 - 2 \left(2e^2 - \left[e^x \right]_0^2 \right) = 4e^2 - 4e^2 + 2(e^2 - 1) = 2(e^2 - 1) \end{aligned}$$
