1      **Abstract**

2      SRF-MADS proteins are transcription factors conserved among eukaryotes that  
3      regulate a variety of cellular functions, however, their physiological roles are still not  
4      well understood in filamentous fungi. Effects of a mutation in *mcmA* gene that encodes  
5      the sole SRF-MADS protein in the fungus *Aspergillus nidulans* were examined by RNA  
6      sequencing. Sequencing data revealed that expression levels of cellulase genes were  
7      significantly decreased by the mutation as reported previously. However, expression  
8      levels of various hemicellulolytic enzyme genes, several extracellular protease genes,  
9      the *nosA* and *rosA* genes involved in sexual development, and AN4394 encoding an  
10     ortholog of EcdR involved in *Aspergillus oryzae* conidiation, were also significantly  
11     decreased by the mutation. As expected from the RNA sequencing data, the *mcmA*  
12     mutant had reduced protease production, cleistothecial development, and conidiation.  
13     This is the first report describing the involvement of SRF-MADS proteins in protease  
14     production in fungi, and asexual and sexual development in *Aspergillus*.

1     **Introduction**

2       MADS box proteins are transcription factors conserved among eukaryotes that are  
3       involved in the regulation of a wide variety of cellular functions. They function in  
4       concert with various cofactors, such that the target genes vary depending on the cofactor  
5       employed. [1] There are two types of MADS proteins, SRF-type and MEF2-type, which  
6       are classified based on the amino acid sequence of the conserved MADS box.  
  
7       *Saccharomyces cerevisiae* expresses two SRF-type proteins, MCM1 and ARG80, and  
8       two MEF2-type proteins, RLM1 and SMP1. These proteins regulate mating-type  
9       specific genes (MCM1), as well as genes regulating cell cycle (MCM1), arginine  
10      metabolism (MCM1 and ARG80), osmotic stress response (SMP1), and cell wall  
11      integrity (RLM1). [2-7]

12       The homologs of these proteins are currently not well-characterized in filamentous  
13      ascomycetes. In the case of SRF-type MADS proteins, MCM1 regulates fruiting body  
14      development in *Sordaria macrospora*, and MoMcm1 regulates male fertility,  
15      microconidium production, and virulence in *Magnaporthe oryzae*. [8, 9] In *A. nidulans*,  
16      McmA regulates expression of cellulase genes. [10] MADS1 in *Fusarium verticillioides*  
17      is involved in the regulation of secondary metabolism, [11] and MadsA controls the  
18      phase transition from yeast to mycelium in *Penicillium marneffei*. [12] Among  
19      MEF-type MADS proteins, RlmA regulates  $\alpha$ -1,3-glucan synthesis in *A. niger* and *A.*

1      *nidulans*. [13, 14] Mig1 is required for infectious growth in *Magnaporthe grisea*. [15]

2

3      These reports suggest that MADS box proteins in filamentous ascomycetes regulate

4      a variety of cellular functions as in *S. cerevisiae*, however studies to identify the

5      multiple roles of a single MADS box protein in a single fungal species have not been

6      performed. In this study, using RNA sequencing we demonstrate the involvement of *A.*

7      *nidulans* McM1 in the regulation of cellulase, hemicellulase, and protease production,

8      as well as asexual and sexual development.

9

1   **Materials and methods**

2   *A. nidulans strains and cultural conditions*

3       *A. nidulans* D6B (*biA1 pyrG89; wA3; argB2::argB::eglAp-taaG2; pyroA4*), [16] the

4       *mcmA<sub>I70A</sub>* mutant (MCMI70A) (*biA1 pyrG89; wA3; ΔmcmA::mcmA<sub>I70A</sub>::pyr4*

5       *argB2::argB::eglAp-taaG2; pyroA4*), and MCMI70AC (*biA1 pyrG89; wA3;*

6       *ΔmcmA::mcmA<sub>I70A</sub>::pyr4 argB2::argB::eglAp-taaG2; pyroA4::pyroA::mcmA<sup>+</sup>*) were

7       used in this study. [10, 16] The strains were grown at 37°C in standard minimal medium

8       (SMM) with appropriate supplements unless otherwise noted. [17]

9

10     *RNA sequencing*

11       *A. nidulans* D6B and MCMI70A strains were pre-cultured for 24 h at 37°C in SMM

12       with 2% glucose as the carbon source. The mycelia were collected and washed with

13       SMM lacking carbon sources. The mycelia (0.5 g) were transferred to 40 ml of fresh

14       SMM containing 0.1 % cellobiose as the carbon source, and cultured at 37°C. The

15       mycelia were harvested at 3 h after inoculation, frozen in liquid nitrogen, and broken

16       with an SK-mill (SK-100, Tokken, Japan). RNA was extracted from the mycelia using

17       the RNeasy Mini Kit (Qiagen) according to the supplier's instructions.

18       RNA sequencing was performed by Genaris, Inc. (Kanagawa, Japan) according to

19       Illumina protocols, and the reads were mapped against the *A. nidulans* genome

1 sequence at the Broad Institute (<http://www.broadinstitute.org>) with TopHat. [18]

2 Transcripts were quantified as FPKM (Fragments Per Kilobase of transcript per Million

3 mapped reads) using Cufflinks. [19]

4

5 *Protease assay*

6 The plate assay for protease production was performed by observing a zone of

7 clearance (halo) around a colony formed by spot inoculation of  $10^6$  conidiospores from

8 each strain on SMM agar with 1% casein as the sole carbon source. Production of

9 protease in submerged cultures was determined as follows. *A. nidulans* strains were

10 pre-cultured for 20 hours in SMM with 1% glucose as the sole carbon source, and then

11 washed with the same medium without a carbon source. The mycelia of approximately

12 0.5g in wet weight were then transferred to 40 ml of SMM with and without a carbon

13 source and further cultivated for 16 h. Carbon sources used included casein, glucose, or

14 cellobiose, at a final concentration of 1%.

15 The protease assay of the culture supernatants at 16 h was carried out at 37°C using

16 azocasein as the substrate using a method described previously. [20] The reaction

17 mixture contained 0.25% azocasein in 50 mM phosphate buffer, pH 7.2. Protease

18 activity was measured as the increase in absorbance at 440 nm per min and per gram dry

1 mycelium.

2

3 *Asexual and sexual development*

4 The development of asexual spores (conida) in *A. nidulans* strains was examined  
5 by counting the number of conidia under a microscope. *A. nidulans* strains were grown  
6 on SMM agar plates for 5 days, and conidia were collected as a suspension in a solution  
7 containing 0.1% Tween 80 and 0.9% NaCl. The number of conidia per square  
8 centimeter of the plate culture was determined.

9 In the examination of sexual development, *A. nidulans* strains were grown at 37°C  
10 for 2 days on SMM agar plates. The plates were then sealed to cause hypoxic conditions  
11 and further incubated at 37°C for 14 days in the dark to induce the formation of  
12 cleistothecia (fruiting bodies). Microscopic observation was carried out using the  
13 SteREO Lumar.V12 (Carl Zeiss, Jena, Germany) stereomicroscope.

14

15 *RNA preparation and Northern blotting analysis*

16 To obtain RNA at the asexual development stage, *A. nidulans* mycelia grown in  
17 SMM submerged culture at 37°C for 22 h were collected, spread onto SMM agar plates,  
18 and further cultivated at 37°C. Growth conditions to detect the protease gene (*prtA*)

1 transcripts were identical to those used for the protease assay.

2 RNA was extracted from *A. nidulans* by TRIzol<sup>®</sup> (Thermo Fisher Scientific Inc.,

3 Waltham, MA, USA) according to the manufacturer's protocol. Total RNA (12 µg) was

4 used in Northern blot analysis, which was performed as previously described. [21]

5 Probes were amplified using the PCR DIG Probe Synthesis Kit (Roche, Mannheim,

6 Germany) with *A. nidulans* cDNA as the template. Primers used for amplification are

7 listed in Table S1. Hybridization signals were detected using CSPD (Roche Applied

8 Science, Penzberg, Germany).

9

10

1      **Results**

2      *Genome-wide screening for possible McmA targets by RNA sequencing.*

3      In a previous study, we demonstrated that a mutation in the *mcmA* gene encoding the

4      SRF-MADS protein McmA causes impaired cellulase production on carboxymethyl

5      cellulose (CMC) and decreased expression of the cellulase genes *eglA*, *eglB*, and *cbhA*.

6      [10] To better understand McmA-mediated gene regulation, the effect of the *mcmA*

7      mutation on genome-wide gene expression was analyzed by RNA sequencing. RNA

8      was extracted from the mycelia of D6B (*mcmA*<sup>+</sup>) and MCMI70A (*mcmA*<sub>I70A</sub>) after 3

9      hours of cellobiose induction that aimed to maximize the expression of genes encoding

10     cellulolytic enzymes. Total numbers of the mapped reads were 101,092,198 for D6B

11     and 81,263,650 for MCMI70A, and average expression levels were 69.61 in D6B and

12     70.09 FPKM in MCMI70A (Table S2). The 7149 genes that had FPKM values of over 5

13     in D6B were selected for further analysis.

14     A more than four-fold decrease of FPKM in MCMI70A was observed in 208 genes

15     compared to those in D6B (Table S2). Among them, 104 genes that had FPKM values

16     above 50 in D6B are listed in Table 1. These include the *eglA* (AN1285), *eglB*

17     (AN3418), and *cbhA* (AN5176) genes, which have been shown to be regulated by

18     McmA, and six additional genes that are possibly involved in cellulose degradation,

1 including three putative lytic polysaccharide monooxygenase genes (AN3860, AN6428,  
2 AN2388), a putative cellobiohydrolase gene *cbhD* (AN1273), and two putative  
3  $\beta$ -glucosidase genes, AN10124 and *bgII* (AN2227). Except for AN6428 and AN2388,  
4 all were highly expressed in D6B, with FPKM values over 500, suggesting that McmA  
5 plays an essential role in cellulose degradation. Since there was a possibility that some  
6 highly-expressed cellulolytic enzyme genes were missing due to low dependency on  
7 McmA, we searched for possible cellulolytic enzyme genes with high FPKM values  
8 (Table S2). No putative cellulolytic enzyme genes with an FPKM value over 500 were  
9 present.

10 In the course of the study on regulation of cellulolytic enzyme genes in *N. crassa* as  
11 well as in *A. nidulans*, Coradetti et al. have reported that the transcription factor ClrB in  
12 *A. nidulans* is essential for the cellulose-induced expression of cellulolytic enzyme  
13 genes as well as a number of hemicellulolytic enzyme genes, and that a total of 141  
14 genes are under its control. [22] Comparison of the McmA-regulated and  
15 ClrB-regulated genes revealed that 17 genes were cooperatively regulated by McmA  
16 and ClrB, including the 7 highly-expressed cellulolytic enzyme genes (Table 2).  
17 However, no endoxylanase and  $\beta$ -xylosidase genes were found to be co-regulated.  
18 Although a single endomannanase gene *manB* was shown to be regulated by both

1      McM<sub>A</sub> and ClrB, no β-mannosidase genes were regulated by McM<sub>A</sub> (Table S2). In  
2      addition, although the highly-expressed endomannanase genes reported are *manC*  
3      (AN6427) and *man134A* (AN2710), [23] they were not regulated by McM<sub>A</sub> (Table S2).  
4      These results imply that cooperative regulation by McM<sub>A</sub> and ClrB is essential for  
5      cellulose degradation and is partially involved in hemicellulose degradation in *A.*  
6      *nidulans*.

7      Besides the polysaccharide-degrading enzyme genes, the RNA sequencing analysis  
8      revealed a possible involvement of McM<sub>A</sub> in protease production and asexual/sexual  
9      development, based on the decrease in expression levels of *prtA*, *nosA*, *rosA*, and  
10     AN4394 in the *mcmA* mutant (Table 1). The *prtA* gene encodes the protease PrtA in *A.*  
11     *nidulans*, [24] *nosA* and *rosA* encode transcription factors involved in regulation of  
12     sexual development, [25, 26] and EcdR, the *A. oryzae* ortholog of AN4394, regulates  
13     early asexual development. [27]

14  
15     *Regulation of protease production by McM<sub>A</sub>*  
16     *A. nidulans* produces an extracellular proteinase, PrtA, as a predominant proteolytic  
17     enzyme. [24] RNA sequencing analysis revealed expression levels of *prtA*, as well as  
18     other protease genes, namely AN7159 (putative tripeptidyl peptidase), AN2555

1 (putative carboxypeptidase), and *pepJ* (deuterolysin-type metallo-proteinase), [28] were  
2 significantly decreased in the *mcmA* mutant (Table 1, Table S2). As shown in Fig. 1A,  
3 while D6B produced a halo around the colony on agar with casein as the sole carbon  
4 source, the *mcmA* mutant MCMI70A failed produce a halo, indicating that protease  
5 production was impaired by the mutation. Reinsertion of the wild type *mcmA* gene into  
6 the mutant restored the protease production (MCMI70AC).

7 Since expression of *prtA* is reported to be induced under starvation conditions, [29]  
8 protease production was examined using various carbon sources as well as  
9 carbon-depleted conditions (Fig. 1B). Carbon-depletion led to significantly higher  
10 protease production in the D6B strain and the *mcmA* mutation caused reduction of  
11 production by approximately 50%. Protease production in D6B using casein, glucose  
12 and cellobiose was low compared to the carbon-depleted conditions, and the *mcmA*  
13 mutation caused further decrease in production.

14 Effect of the *mcmA* mutation on the *prtA* expression was examined by Northern blot  
15 analysis (Fig. 2). At 4h after the transfer of the pre-grown mycelia to fresh media,  
16 detectable amounts of the *prtA* mRNA accumulated in D6B, except when glucose was  
17 used, which is likely due to carbon catabolite repression. The *mcmA* mutation caused a  
18 decrease in *prtA* transcription under all the conditions examined. At 16 h after the

1 transfer, the D6B strain accumulated *prtA* mRNA under all the conditions, and the  
2 *mcmA* mutation caused a significant decrease in expression in casein, glucose, and  
3 cellobiose. Strikingly, significant amounts of *prtA* mRNA accumulated in the *mcmA*  
4 mutant under carbon-depleted conditions, although the mRNA level was lower than that  
5 in D6B. These observations imply that *mcmA* is involved in regulation of protease genes,  
6 however, it may not be necessary in induction of *prtA* expression under carbon-starved  
7 conditions.

8 Despite the accumulation of *prtA* mRNA in D6B under all the conditions at 16 h,  
9 protease production on casein, glucose, and cellobiose was significantly lower than that  
10 under carbon-starved conditions (Fig. 1B). Such discrepancy might be attributable to  
11 differences in the time-course profiles of *prtA* mRNA accumulation; in other words, the  
12 final amount of PrtA in the culture broth is affected by the time when the transcription is  
13 triggered during the course of cultivation.

14

15 *Involvement of McmA in regulation of sexual development*

16 Expression of the *nosA* and *rosA* genes, which encode transcription factors involved  
17 in sexual development, [25, 26] was significantly decreased by the *mcmA* mutation  
18 according to the RNA sequencing analysis (Table 1). As *nosA* and *rosA* expression is

1 upregulated during late asexual development, Northern blot analysis was performed  
2 with the mycelia grown on agar plates as described previously. [25, 26] As shown in Fig.  
3 3, the *nosA* and *rosA* transcripts in D6B transiently increased at the initial 5h stage, then  
4 decreased for 24 hours, and again increased at 29h and 35h. In the *mcmA* mutant,  
5 significantly decreased *nosA* and *rosA* expression was observed throughout the  
6 cultivation, confirming that McmA regulates expression of these two genes.

7 As a consequence of sexual development, *A. nidulans* forms spherical fruiting  
8 bodies called cleistothecia, which contain ascospores. To assess the effect of the *mcmA*  
9 mutation on sexual development, cleistothelial formation by the mutant strain was  
10 examined. While the strain D6B formed cleistothecia with a blackball-like appearance,  
11 no cleistothelial formation was observed in the *mcmA* mutant (Fig. 4).

12

13 *Involvement of McmA in regulation of asexual development*

14 Expression of AN4394, which is an ortholog of *ecdR* in *A. oryzae*, [27] was found to  
15 be significantly decreased in the *mcmA* mutant based on RNA sequencing analysis  
16 (Table 1). The *ecdR* gene encodes the basic helix-loop-helix transcription factor  
17 involved in the early stage of conidiophore development in *A. oryzae*, which suggests  
18 that McmA regulates asexual development via regulation of AN4394. Furthermore,

1 decrease in the expression of *brlA*, the C2H2 zinc finger transcription factor involved in  
2 conidiophore development, [30] was also observed in the *mcmA* mutation (Table S2).  
3 Examination of the conidiospore-forming activity of D6B and the *mcmA* mutant  
4 revealed a ~ 50% decrease in conidiospore formation in the mutant, that is, while D6B  
5 formed  $(1.05 \pm 0.03) \times 10^8$  spores / cm<sup>2</sup>, the mutant formed  $(0.53 \pm 0.06) \times 10^8$  spores/  
6 cm<sup>2</sup>.

7 Expression levels of AN4394 and *brlA* under plate culture conditions were  
8 determined by Northern blot analysis. In the D6B strain, expression of AN4394 was  
9 transiently enhanced at an initial stage, with a peak at 5h after the transfer of the  
10 mycelia on to the agar plate, and expression decreased afterwards. The *brlA* expression  
11 occurred just after the peak expression of AN4394 with a peak at 11h and then  
12 decreased afterwards, suggesting that AN4394 enhances expression of *brlA*. In the  
13 *mcmA* mutant, the transiently enhanced expression of AN4394 was weak, and  
14 expression of *brlA* was significantly delayed, potentially leading to the delayed  
15 formation of conidiospores.

16

1     **Discussion**

2       We have reported in a previous study that the SRF-MADS box protein McmA in *A.*  
3     *nidulans* regulates the endoglucanase genes *eglA* and *eglB*, as well as the putative  
4     cellobiohydrolase gene *cblA*. [10] Our study revealed that there were 7 highly  
5     expressed cellulolytic enzyme genes when cellobiose was the carbon source, and that all  
6     these genes were regulated by McmA. Our findings indicated the essential role of  
7     McmA in cellulose degradation. Furthermore, we found McmA also regulated protease  
8     production and asexual/sexual development.

9       SRF-MADS proteins function in concert with cofactors, which are mostly  
10      transcription factors. [1] In the case of regulation of cellulolytic enzyme genes, the most  
11      likely McmA partner is ClrB, based on studies of the *eglA* promoter. This promoter has  
12      a single *cis*-element, designated CeRE, [16] that is required for inductive expression,  
13      and thus ClrB may bind to this element to regulate induction. Since McmA does bind to  
14      CeRE, [10] it is highly possible that the gene is regulated through interaction between  
15      McmA and ClrB. It should be noted that only 17 genes in Table 2 showed McmA  
16      dependency among the 141 ClrB-regulated genes. [22] Regulatory systems mediated by  
17      ClrB may be similar to those regulated by Ste12p in *S. cerevisiae*, in which, while  
18      Ste12p alone regulates pheromone-regulated genes, it also co-regulates **a**-specific genes  
19      with Mcm1p. [31] Strikingly, AN2184, an ortholog of *Neurospora crassa cdtI* that  
20      encodes a cellobiose transporter, [32] was not regulated by McmA, although its  
21      expression level was extremely high, with FPKM of over 3000 in the D6B strain (Table  
22      S2). This suggests that the role of McmA is limited to cellulose hydrolysis, while ClrB  
23      regulates the whole system of cellulose utilization.

24      As is the case for regulation of cellulolytic genes, an McmA cofactor is likely to

1 exist for the regulation of protease production and asexual/sexual development.  
2 Currently identified transcriptional activators, AreA, XprG, and PacC, might function as  
3 cofactors in the regulation of the extracellular protease gene *prtA*. [29, 33, 34] In *A.*  
4 *niger*, the induction of extracellular protease is regulated by the transcriptional activator  
5 PrtT. [35] However, *A. nidulans* lacks an ortholog of *prtT*. Consistent with the lack of  
6 *prtT*, extracellular proteases are not induced by exogenous proteins, instead they are  
7 produced under carbon-, nitrogen- or sulfur-limiting conditions and at neutral to alkaline  
8 pH. [34, 36] AreA and XprG are responsible for *prtA* expression under nitrogen  
9 starvation, XprG is responsible under carbon starvation, and PacC is responsible at  
10 higher pH conditions. [29, 34, 37] McmA does not seem to regulate these transcription  
11 factor genes since the expression of *areA*, *xprG*, and *pacC* was not significantly affected  
12 by the *mcmA<sub>I70A</sub>* mutation (Table S2). It is possible that one of these factors may  
13 regulate *prtA* expression in concert with McmA.

14 Among the many transcription factors involved in regulation of sexual development,  
15 [38] *nosA* and *rosA* gene expression was greatly decreased by the *mcmA* mutation.  
16 NosA is a Zn(II)<sub>2</sub>Cys<sub>6</sub> transcription factor that promotes cleistothelial formation. [25]  
17 Although no transcription factor has been identified that activates *nosA* expression,  
18 NsdD might be involved in cooperative regulation with McmA, as it has been suggested  
19 that NosA acts in the same pathway downstream of NsdD or in a parallel pathway. [25]  
20 Another possible McmA partner is SteA, which is also required for cleistothelial  
21 development. [39] The orthologs of McmA and SteA in *S. cerevisiae*, Mcm1p and  
22 Ste12p, physically interact and regulate mating type-specific genes. [40] Interaction of  
23 the orthologs in *Sordaria macrospora*, MCM1 and STE12, was also reported. In this  
24 organism, MCM1 but not STE12 is required for fruiting body development, while

1 STE12 deletion affects the ascus and ascospore development, implying functional  
2 divergence within the fungal STE12 transcription factor family. [8, 41] The *rosA* gene is  
3 a paralog of *nosA*, however it encodes a repressor of sexual development. [26] In our  
4 experimental conditions, their expression profiles, along with growth, were nearly  
5 identical and both displayed McmA dependency for their expression (Fig. 3). This  
6 indicates the presence of transcripts for an activator and a repressor at the same time,  
7 suggesting that external stimuli might regulate translation or activity of these proteins.

8 The *mcmA* mutation caused decreased expression of AN4394 (Table 1), an ortholog  
9 of *ecdR* in *A. oryzae*, [27] as well as decreased conidiospore formation. The deletion of  
10 *ecdR* in *A. oryzae* causes a decrease in expression of *brlA*, which is essential to  
11 conidiation in *A. nidulans*. [30] Consistent with this, *brlA* expression also decreased in  
12 the *mcmA* mutant (TableS2), suggesting that AN4394 functions similarly to EcdR.  
13 Regulation of conidial development in *A. nidulans* is regulated by various transcription  
14 factors, and FlbB, FlbC, FlbD are thought to function upstream of BrlA. [42] Currently,  
15 AN4394 is not well characterized in *A. nidulans*, however these Flb proteins might  
16 function in concert with McmA for regulation of conidial development.

17 Consequently, we have shown for the first time in filamentous fungi that the  
18 SRF-MADS protein is involved in various cellular functions including cellulase,  
19 hemicellulase, and protease production, as well as asexual and sexual development.  
20 Identification of partner proteins of McmA in each regulatory system, and also  
21 understanding the regulation McmA at the transcriptional and post-transcriptional levels  
22 will uncover the precise mechanisms of McmA, a wide domain transcription factor of  
23 biological and biotechnological importance.

24

1    **Author contribution**

2    Tetsuo Kobayashi and Masashi Kato designed the study. Nuo Li, Emi Kunitake,  
3    Yoshikazu Endo and Miki Aoyama carried out the experiments. Masashi Kato, Makoto  
4    Kimura, and Kyoko Kanamaru supervised all the experiments. Nuo Li drafted the  
5    manuscript, and Tetsuo Kobayashi critically revised the manuscript.

1    **Figure legends**

2    Fig. 1. Protease production in the parental strain D6B and the *mcmA* mutant. Protease  
3    production on agar plate culture with casein as the sole carbon source (A), and that in  
4    liquid culture with various carbon sources (B). I70A in (B) denotes MCMI70A. Error  
5    bars represent standard errors of three independent experiments.

6

7    Fig. 2. Expression of the *prtA* gene with various carbon sources and effect of the *mcmA*  
8    mutation on its expression. I70A denotes MCMI70A. The expression level was  
9    evaluated at 4h and 16h after the transfer of pre-grown mycelia to the medium with  
10   indicated carbon sources.

11

12   Fig. 3. Time course expression of *nosA* and *rosA* genes and effect of the *mcmA* mutation  
13   on their expression. Times after the transfer of pre-cultured mycelia to agar plates are  
14   shown above the Northern blots.

15

16   Fig. 4. Effect of the *mcmA* mutation on cleistothecial development. The white arrows  
17   indicate cleistothecial formation.

18

1 Fig. 5. Effect of the *mcmA* mutation on expression of AN4394 and *brlA*. Times after the  
2 transfer of pre-cultured mycelia to agar plates are shown above the Northern blots.  
3

Table 1. Possible targets of McmA. Genes with FPKM values of over 50 in D6B and D6B/I70A FPKM ratio of over 4 are shown. The data on the genes with FPKM below 50 is available from the supplementary table 1. Genes encoding carbohydrate-active enzymes are shadowed. Descriptions of the genes were obtained from AspGD web site.

AN No.	D6B (FPKM)	MCMI70A (FPKM)	Description
3860	3572	17	putative lytic polysaccharide monooxygenase (AA9)
10124	3391	789	$\beta$ -glucosidase (GH1)
3418	2969	441	<i>eglB</i> ; endo- $\beta$ -1,4-glucanase (GH7)
4049	2587	371	conserved hypothetical protein
4575	2254	49	conserved hypothetical protein
1285	2062	77	<i>eglA</i> ; endo- $\beta$ -1,4-glucanase (GH5)
8781	1050	83	conserved hypothetical protein
1273	851	13	<i>cbhD</i> ; putative cellobiohydrolase (GH7)
9001	715	128	hypothetical protein
2227	680	95	<i>bgII</i> ; putative $\beta$ -glucosidase (GH3)
2578	595	96	peroxidase_2 superfamily
5176	576	86	<i>cbhA</i> ; putative cellobiohydrolase (GH7)
2436	543	126	<i>aclB</i> ; putative ATP citrate synthase
8609	436	84	hypothetical protein
5267	430	15	<i>faeC</i> ; feruloyl esterase (CE1)
7795	425	85	<i>gprK</i> ; putative trimeric G-protein coupled receptor
4264	412	72	conserved hypothetical protein
4888	406	64	<i>pdcA</i> ; putative pyruvate decarboxylase
3141	366	55	conserved hypothetical protein
4051	358	56	conserved hypothetical protein
5130	345	69	putative coproporphyrinogen III oxidase
5558	341	24	<i>prtA</i> ; alkaline protease
1848	314	60	<i>nosA</i> ; sexual development transcription factor
11227	307	67	putative 70 kilodalton heat shock protein
0726	300	58	<i>sunB</i> ; SUN domain-containing protein (GH131)
0964	297	4	conserved hypothetical protein
9035	288	42	<i>aglG</i> ; putative $\alpha$ -galactosidase (GH36)
1037	284	54	<i>odeA</i> ; oleate delta-12 desaturase
2993	260	44	AIM24 superfamily

12088	247	18	conserved hypothetical protein
8907	243	27	putative C-4 methylsterol oxidase
6657	221	37	conserved hypothetical protein
5046	220	3	defencin_2 superfamily
4923	207	48	putative 3-hydroxy-3-methylglutaryl CoA synthase
3297	199	12	<i>manB</i> ; endo- $\beta$ -1,4-mannanase (GH5)
2120	194	39	<i>kapJ</i> ; putative karyopherin (importin) beta 3
7541	191	8	<i>cut2</i> ; cutinase (CE5)
2538	174	8	hypothetical protein
0736	172	7	conserved hypothetical protein
2954	159	17	conserved hypothetical protein
5172	151	16	hypothetical protein
12123	148	10	hypothetical protein
9407	147	34	<i>fasA</i> ; fatty acid synthase, $\alpha$ subunit
3226	146	4	short-chain dehydrogenase
10318	139	28	predicted GPI-anchored protein
10588	138	5	conserved hypothetical protein
8167	138	29	conserved hypothetical protein
4702	137	22	conserved hypothetical protein
0698	134	33	conserved hypothetical protein
7214	131	21	putative flavine containing amine oxidase
6168	129	15	<i>maeA</i> ; putative malate dehydrogenase
1586	128	17	putative copper amine oxidase
0453	127	15	<i>pclA</i> ; putative G1/S cyclin
5320	125	27	domain with predicted hydrolase activity (CE NC)
11077	124	19	putative sugar O-acetyltransferase
3613	124	31	<i>xlnA</i> ; endo- $\beta$ -1,4-xylanase (GH11)
1608	121	15	conserved hypothetical protein
8981	117	16	<i>alcS</i> ; conserved hypothetical protein
9142	117	5	conserved hypothetical protein
5169	111	21	SAM and PH domain-containing protein
10964	108	22	domain with predicted methyltransferase activity
10090	107	23	conserved hypothetical protein
4394	101	12	positive regulator of conidiation in <i>A. oryzae</i>
10296	100	6	flavocytochrome c protein
8218	99	11	<i>trxB</i> ; putative thioredoxin reductase

7159	99	20	putative tripeptidyl-peptidase
6428	99	12	putative lytic polysaccharide monooxygenase (AA9)
6621	95	5	abhydrolase family protein
0759	94	12	PLAC8 family protein
1818	93	20	<i>xlnC</i> ; endo- $\beta$ -1,4-xylanase (GH10)
7532	90	19	hypothetical protein
1338	90	4	hypothetical protein
0457	88	7	hypothetical protein
11008	91	8	putative squalene monooxygenase
2701	87	10	WD domain-containing protein
11006	87	5	conserved hypothetical protein
9297	86	1	myosin-cross-reactive antigen family protein
0364	86	20	fungal transcription factor
8611	82	0	PNP_UDP_1 superfamily protein
11510	81	3	similar to atesin-3 of <i>A. terreus</i>
3606	77	18	conserved hypothetical protein
4795	76	14	conserved hypothetical protein
7794	72	10	conserved hypothetical protein (CBM18)
2388	70	3	putative lytic polysaccharide monooxygenase (AA9)
2983	69	16	<i>msb1</i> ; putative Rho GTPase-activating protein
5170	68	2	<i>rosA</i> ; sexual development transcription factor
3567	67	9	conserved hypothetical protein
0377	67	11	aldo-keto reductase family protein
2386	66	14	conserved hypothetical protein
0565	65	11	<i>pyrABCN</i> ; pyrimidine biosynthesis
2951	64	9	putative UDP-glucose 4-epimerase
1577	63	2	major facilitator super family (MFS) protein
2549	62	4	<i>easD</i> ; putative acyl-CoA ligase
3298	62	14	predicted protein disulfide oxidoreductase domain
4127	61	1	conserved hypothetical protein
8683	56	9	putative metalloreductase transmembrane component
8544	55	9	conserved hypothetical protein
6046	55	12	putative p67phox regulatory subunit homolog
9380	53	3	putative chitin deacetylase (CE4)
0245	53	6	putative endo-1,3(4)- $\beta$ -glucanase (GH16)
2955	53	9	putative glycosyl transferase (GT4)

2632	52	0	<i>axhB</i> ; putative α-L-arabinofuranosidase (GH62)
6620	52	2	putative endo-1,3-β-glucanase (GH16)
5444	50	3	putative tryptophan synthase

Table 2. Genes possibly regulated by both McmA and ClrB. Descriptions of the genes were obtained from AspGD web site.

AN No.	D6B (FPKM)	I70A (FPKM)	Description
3860	3572	13	putative lytic polysaccharide monooxygenase (AA9)
10124	3391	38	$\beta$ -glucosidase (GH1)
3418	2969	16	<i>eglB</i> ; endo- $\beta$ -1,4-glucanase (GH7)
1285	2062	6	<i>eglA</i> ; endo- $\beta$ -1,4-glucanase (GH5)
1273	851	3	<i>cbhD</i> ; putative cellobiohydrolase (GH6)
2227	680	13	<i>bgII</i> ; putative $\beta$ -glucosidase (GH3)
5176	576	2	<i>cbhA</i> ; putative cellobiohydrolyase (GH7)
9035	288	1	<i>aglG</i> ; putative $\alpha$ -galactosidase (GH36)
3297	199	0	<i>manB</i> ; endo- $\beta$ -1,4-mannanase (GH5)
5320	125	0	domain with hydrolase activity (CE NC)
11077	124	3	domain with acetyltransferase activity
6428	99	6	lytic polysaccharide monooxygenase (AA9)
1577	63	0	MFS transporter
3298	62	8	domain with protein disulfide oxidoreductase activity
2632	52	0	<i>axhB</i> ; putative $\alpha$ -L-arabinofuranosidase (GH62)
8241	38	9	<i>chiA</i> ; endochitinase (GH18)
2804	37	3	putative $\beta$ -galactosidase (GH35)
