Abstract We disclose our synthetic studies on bilobalide, which features a Diels-Alder reaction of a cyclic anhydride to from two contiguous quaternary carbons, desymmetrization of a symmetric diol, and construction of a cyclic acetal under acidic conditions with inversion of configuration at an allylic position.

Key words desymmetrization, Diels-Alder reaction, Mukaiyama hydration, quaternary carbon, tertiary alcohol

Bilobalide is a sesquiterpene, whose isolation from leaves of the ginkgo tree was first reported in 1967 and then in $1969 .{ }^{1}$ Structural elucidation by Nakanishi and coworkers in 1971 showed that bilobalide has a tetracyclic skeleton composed of three lactone rings and a cyclopentane ring, on which two hydroxy groups and a tert-butyl group are substituted (Figure 1). ${ }^{2}$ The substituents and the complicated connection of the rings form six contiguous stereogenic centers, which contain two quaternary carbons and a tertiary alcohol moiety. These intriguing structural features, as well as its biological activities such as neuroprotective activity, ${ }^{3}$ antagonism against GABA receptor, ${ }^{4}$ and others, have attracted much attention in chemistry, and the total syntheses of bilobalide have been reported by three research groups. ${ }^{5}$ Herein we disclose our synthetic studies on bilobalide.

Figure 1 Structure of Bilobalide

Our retrosynthetic analysis is shown in Scheme 1. We paid attention to the symmetrical component in the structure of bilobalide (1). Thus, removal of the hydroxy groups and the tert-butyl group, as well as cleavage of the lactone rings would generate symmetrical compound 2. Connection of the two carbonyl groups in ester moieties would form cyclohexene 3, which could be constructed via a Diels-Alder reaction of cyclic anhydride 4. The Diels-Alder reaction is a reliable tool that constructs contiguous quaternary carbons, ${ }^{6}$ and therefore we commenced our synthesis with preparation of the requisite cyclic anhydride.

Scheme 2 Synthetic Studies toward Bilobalide.

A reaction of cyclopentadiene (5) with singlet oxygen in the presence of thiourea afforded a diol, ${ }^{7}$ which was protected with TBS groups (Scheme 2). Ozonolysis of the resulting cyclopentene 6 produced dialdehyde 7, which was subjected to the Corey-Fuchs alkyne synthesis with a 2 -step conversion, 8 giving diyne 8. A palladium-mediated reductive cyclization converted the diyne into diene 9,9 which was immediately reacted with singlet oxygen. Reduction of the resulting endoperoxide with zinc and acetic acid afforded diol 10. AZADO oxidation of the diol furnished dicarboxylic acid, ${ }^{10,11}$ which was converted into cyclic anhydride 11 by heating in acetic anhydride.
The Diels-Alder reaction of the cyclic anhydride with butadiene proceeded smoothly at room temperature. The reaction occurred stereoselectively from the less substituted face, giving a tricyclic compound having two quaternary carbons. Reduction of the anhydride moiety in $\mathbf{1 2}$ via formation of a diester was followed by protection of the resulting diol 13 with benzyl groups. Deprotection with TBAF afforded diol 14.
Desymmetrization of the molecule could be achieved at this stage. PCC oxidation afforded $\beta$-hydroxyketone 15 in good yield. A slightly excess amount of PCC did not affect the results. This
indicates that the reactivity of the remaining hydroxy group in 15 was significantly reduced by the electron withdrawing nature of the ketone moiety. Elimination of the hydroxy group via formation of a mesylate produced enone 16. Addition of tertbutyllithium to the enone moiety occurred smoothly at $-78^{\circ} \mathrm{C}$ to give alcohol $\mathbf{1 7}$ as a sole isomer, although the stereochemsitry could not be determined. 1,3-Isomerization of the tertiary alcohol moiety in $\mathbf{1 7}$ was mediated by 2,3,4,5tetrafluorophenylboronic acid to give a 2:1 inseparable mixture of 18a and 18b. ${ }^{12,13}$ Selective ozonolysis of the less hindered C-C double bond on the cyclohexene ring furnished a mixture of aldehydes including 19 and 20. Upon treatment with sulfuric acid in methanol, inversion of configuration at the allylic position in $\mathbf{2 0}$ occurred, and both $\mathbf{1 9}$ and $\mathbf{2 0}$ could be converted into acetal 21a and 21b. ${ }^{14,15,16}$ After separation of the diastereomer, removal of the benzyl groups of both isomers 21a and 21b could be carried out under usual conditions in the presence of the trisubstituted C-C double bond, giving diol 22a and $\mathbf{2 2 b}$, the latter of which was identical to the intermediate in the Corey's synthesis. ${ }^{5 \mathrm{a}, 17,18}$
On the other hand, we tried to form the tertiary alcohol moiety of bilobalide, starting from 21b. ${ }^{19}$ Mukaiyama hydration with

Shenvi's modification could convert 21b into tertiary alcohol 23 in $67 \%$ yield. ${ }^{20,21}$ Although the stereochemistry of the reaction could not be confirmed at this stage, we conducted further transformation of tertiary alcohol 23. Thus, Birch reduction removed the benzyl groups to give triol 24, which was subjected to Swern oxidation. In the latter transformation we attempted to simultaneously oxidize the two primary alcohol moieties to obtain the corresponding dialdehyde. The reaction of 24, however, afforded tetracyclic compound 25 in $97 \%$ yield. ${ }^{22}$ The bulky tert-butyl group might hamper the Swern oxidation of the adjacent primary alcohol moiety, and the resulting monoaldehyde underwent formation of cyclic acetals via an unusual transposition of a methoxy group in the dimethyl acetal, leading to 25 . The structure of compound 25 was confirmed by using 2D NMR techniques, including H-H COSY, HMQC, HMBC and NOESY, which revealed that the Mukaiyama hydration afforded the product with the stereochemistry opposite to that of bilobalide.

Scheme 3 Formation of the Tertiary Alcohol Moiety via Mukaiyama Hydration.

In conclusion, through our synthetic studies on bilobalide, we achieved construction of the two contiguous quaternary carbons and introduction of the tert-butyl group, resulting in establishing another synthetic route toward the Corey's intermediate.

(13) 3a,7a-bis((benzyloxy)methyl)-3-(tert-butyl)-3a,4,7,7a-tetrahydro- $\mathbf{1 H}$-inden-1-ol (18a and 18b) To a solution of enone $16(23 \mathrm{mg}, 0.061 \mathrm{mmol})$ in THF $(1.0 \mathrm{ml})$ was added tertbutyllithium ( 1.53 M solution in hexane, $0.048 \mathrm{ml}, 0.073 \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$, and the mixture was stirred for 15 min . The reaction was then quenched with water, and the resulting mixture was extracted three times with EtOAc. The organic layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated under reduced pressure. The residual oil containing 17 was used for the next step without further purification. To a stirred solution of the above crude material in toluene ( 1.0 ml ) was added 2,3,4,5-tetrafluorophenylboronic acid
( $2 \mathrm{mg}, 0.01 \mathrm{mmol}$ ) at room temperature. The mixture was heated at $50^{\circ} \mathrm{C}$ with stirring for 2 h . After cooling to room temperature, the reaction mixture was concentrated in vacuo and the residue was purified by preparative TLC (EtOAc-hexane $=1: 3$ ) to give a 2:1 mixture of $\mathbf{1 8 a}$ and $\mathbf{1 8 b}$ ( $18 \mathrm{mg}, 0.042 \mathrm{mmol}, 68 \%$ ) as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.35-7.23(\mathrm{~m}, 10 \mathrm{H}), 5.75$ $(\mathrm{d}, J=2.8 \mathrm{~Hz},(1 / 3) 1 \mathrm{H}), 5.73(\mathrm{~m},(2 / 3) 1 \mathrm{H}), 5.68-5.60(\mathrm{~m}$, $(1 / 3) 2 \mathrm{H}+(2 / 3) 1 \mathrm{H}), 5.57(\mathrm{~d}, J=1.6 \mathrm{~Hz},(2 / 3) 1 \mathrm{H}), 4.98(\mathrm{~d}, J=1.6$ $\mathrm{Hz},(2 / 3) 1 \mathrm{H}), 4.52-4.28(\mathrm{~m},(1 / 3) 4 \mathrm{H}+(2 / 3) 44 \mathrm{H}), 4.03(\mathrm{~d}, J=11.2$ $\mathrm{Hz},(1 / 3) 1 \mathrm{H}), 3.81-3.75(\mathrm{~m},(1 / 3) 1 \mathrm{H}+(2 / 3) 1 \mathrm{H}), 3.53-3.47(\mathrm{~m}$, $(1 / 3) 2 \mathrm{H}+(2 / 3) 1 \mathrm{H}), 2.48-2.14(\mathrm{~m},(1 / 3) 2 \mathrm{H}+(2 / 3) 4 \mathrm{H}), 2.03(\mathrm{~d}, J=$ $18.0 \mathrm{~Hz},(1 / 3) 1 \mathrm{H}), 1.76(\mathrm{~d}, J=18.8 \mathrm{~Hz},(1 / 3) 1 \mathrm{H}), 1.10(\mathrm{~s}$, $(1 / 3) 9 \mathrm{H}), 1.09$ (s, (2/3)9H); ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 157.4$, 156.7 (C), 139.0, 138.5 (C), 138.4, 136.8 (C), 128.5 (CH), 128.4 (CH), 128.2 (CH), 128.2 (CH), 128.2 (CH), 128.0 (CH), 127.6, (CH), $127.4(\mathrm{CH}), 127.4(\mathrm{CH}), 127.3(\mathrm{CH}), 126.3,125.7(\mathrm{CH}), 124.7$, $123.5(\mathrm{CH}), 81.0,80.3(\mathrm{CH}), 74.1\left(\mathrm{CH}_{2}\right), 73.5\left(\mathrm{CH}_{2}\right), 73.5\left(\mathrm{CH}_{2}\right)$, $73.3\left(\mathrm{CH}_{2}\right), 73.0\left(\mathrm{CH}_{2}\right), 72.8\left(\mathrm{CH}_{2}\right), 72.7\left(\mathrm{CH}_{2}\right), 72.6\left(\mathrm{CH}_{2}\right), 54.6$, 53.9 (C), 52.3, $48.4(\mathrm{C}), 34.5,34.3(\mathrm{C}), 34.1\left(\mathrm{CH}_{2}\right), 30.8,30.8\left(\mathrm{CH}_{3}\right)$, $29.4\left(\mathrm{CH}_{2}\right), 28.3\left(\mathrm{CH}_{2}\right), 25.7\left(\mathrm{CH}_{2}\right)$; HRMS (ESI+) 455.2549 (calcd for $\mathrm{C}_{29} \mathrm{H}_{36} \mathrm{NaO}_{3}: 455.2562$ ).
