EXPERIMENTAL DESIGN		
Definition of experimental and control groups  Number within each group	E E	Temporal and spatial expression pattern was analyzed.  Several individuals were pooled in each sample (please see Materials and Methods).
Number within each group	E	Sample preparation and quantitative RT-PCR were carried out in NIAS (Figs. 1 and 3)
Assay carried out by core lab or investigator's lab?	D	and Nagoya University (Fig. 2).
, ,		C. M. and T. S. designed the experiments; C. M., F. I. and Y. W. performed
Acknowledgement of authors' contributions	D	experiments and analyzed the data.
SAMPLE		
Description	E	The red flour beetle, <i>Tribolium castaneum</i> Several individuals were combined for RNA isolation of the embryos and the first,
		second, and third larval instars. RNA was isolated from individuals for the sixth and
Volume/mass of sample processed	D	seventh larval instars, pupal and adult stages.
volume/mass of sample processed	D	Whole body was used for RNA extraction (Fig. 1).
		Whole embryo was used for RNA extraction (Fig. 2).
Microdissection or macrodissection	E	Larvae were cut in half between thoracic segments T2 and T3 (Fig. 3A).
		Basically, insects or embryos were homogenized in homogenizing reagent for RNA
Processing procedure	E	isolation (i.e. TRIzol or RNeasy Plus mini kit), without freezing.
If frozen - how and how quickly?	E	Insects were homogenized without freezing.
700 1 11 1 1 1 1 1	-	Insects were homogenized in homogenizing reagent for RNA isolation (i.e. TRIzol or
If fixed - with what, how quickly?	E	RNeasy Plus mini kit), without freezing.  Homogenized samples in homogenizing reagent for RNA isolation were stored at -80'
Sample storage conditions and duration (especially for FFPE samples)	E	C until RNA extraction.
NUCLEIC ACID EXTRACTION	£	C until KIVA extraction.
ACCEDIC ACID EXTRACTION		TRIzol reagent (Fig. 2) or RNeasy Plus mini kit (Figs. 1 and 3) were used for RNA
Procedure and/or instrumentation	E	extraction.
		TRIzol reagent (Fig. 2) or RNeasy Plus mini kit (Figs. 1 and 3).
Name of kit and details of any modifications	E	RNA extraction was performed according to the manufacturer's instruction.
		Chloroform, isopropanol and ethanol for molecular biology were used for RNA
Source of additional reagents used	D	isolation using TRIzol.
		When using RNeasy Plus mini kit, gDNA Eliminator Column was used according to
	_	the instruction. When using TRIzol reagent, total RNA was treated with DNase I in
Details of DNase or RNAse treatment	E	order to eliminate gDNA before reverse transcription.  In subsequent quantitative RT-PCR, no reverse transcription control was prepared to
Control (DNA DNA)	т.	access the amount of amplicon generated from contaminated genomic DNA.
Contamination assessment (DNA or RNA)  Nucleic acid quantification	E E	Total RNA was quantified by measuring the absorbance at 260 nm.
Nucleic acid quantification	L L	Nano-drop Spectrophotometer, Hitachi double-beam uv-vis Spectrophotometer, or
Instrument and method	E	SimpliNano Spectrophotometer (GE Healthcare)
Purity (A260/A280)	D	A260/A280 was calculated to confirm that the purity of total RNA is high enough.
Yield	D	RNA concentration was calculated from A260.

qPCR PROTOCOL		
		In experiments shown in Figs. 1 and 3A, qPCR was performed using LightCycler 2.0
		(Roche Diagnostics). Quantitative RT-PCR was carried out in a 20 µl reaction volume
		containing SYBR Premix Ex Taq (Takara Bio), 0.2 µM of each primer and 2–3µl of
		template cDNAs or standard plasmids. PCR conditions were 95 °C for 10 s, followed
		by 45 cycles at 95°C for 5 s and 60°C for 20 s. After PCR, the absence of unwanted
		byproducts was confirmed by melting curve analysis. For standards, serial dilutions of
		a plasmid containing the ORF of each gene were used. TcrpL32 (synonymous with
		rp49) was used as a reference gene.
		In experiments shown in Fig. 2, qPCR was performed using Thermal Cycler Dice Real
		Time System (model TP800, Takara Bio). Quantitative RT-PCR was carried out in a
		12 μl reaction volume containing SYBR Premix Ex Taq (Takara Bio), 0.2 μM of each
		primer and 1 µl of template cDNAs or standard plasmids. PCR conditions were 95 °C
		for 30 s, followed by 45 cycles at 95°C for 5 s and 60°C for 30 s. After PCR, the
		absence of unwanted byproducts was confirmed by melting curve analysis. For
		standards, serial dilutions of a plasmid containing the ORF of each gene were used.
Complete reaction conditions	E	TcrpL32 was used as a reference gene. In experiments snown in Figs. 1 and 3A, qPCR was carried out in a 20 μ1 reaction
		volume containing SYBR Premix Ex Taq (Takara Bio), 0.2 μM of each primer and 2–
		3μl of template cDNAs or standard plasmids.
		In experiments shown in Fig. 2, qPCR was performed in a 12 μl reaction volume
		containing SYBR Premix Ex Taq (Takara Bio), 0.2 µM of each primer and 1 µl of
Reaction volume and amount of cDNA/DNA	E	template cDNAs or standard plasmids.
Deiman (make) Mall of Difference of	10	Primer concentration was 0.2 µM.
Primer, (probe), Mg++ and dNTP concentrations	E	Mg2+ and dNTP were already included in 2x SYBR Premix Ex Taq.
Polymerase identity and concentration	E	Ex Taq HS DNA polymerase
Buffer/kit identity and manufacturer	E	SYBR Premix Ex Taq (Takara Bio)
Exact chemical constitution of the buffer	D	TaKaRa Ex Taq HS, dNTP Mixture, Mg2+, SYBR Green I
Additives (SYBR Green I, DMSO, etc.)	E	SYBR Green I was already included in 2x SYBR Premix Ex Taq.
		In experiments shown in Figs. 1 and 3A, LightCycler capillaries (Roche Diagnostics)
		were used.
Manufacturer of plates/tubes and catalog number	D	In experiments shown in Fig. 2, Hi-8 tubes with flat caps (Takara Bio) were used. In experiments snown in Figs. 1 and 3A, PCK conditions were 95°C for 10 s,
		followed by 45 cycles at 95°C for 5 s and 60°C for 20 s.
		In experiments shown in Fig. 2, PCR conditions were 95 °C for 30 s, followed by 45
		cycles at 95°C for 5 s and 60°C for 30 s.
		In both cases, the absence of unwanted byproducts was confirmed by melting curve

MIQE checklist for authors, reviewers and editors. All essential information (E) must be submitted with the manuscript. Desirable information (D) should be submitted if available. If using primers obtained from RTPrimerDB, information on qPCR target, oligonucleotides, protocols and validation is available from that source.

- \*: Assessing the absence of DNA using a no RT assay is essential when first extracting RNA. Once the sample has been validated as RDNA-free, inclusion of a no-RT control is desirable, but no longer essential.
- \*\*: Disclosure of the probe sequence is highly desirable and strongly encouraged. However, since not all commercial pre-designed assay vendors provide this information, it cannot be an essential requirement. Use of such assays is advised against.
