Proposal of Web Browser for Touch Panel Display

Akie Yamauchi

Department of System and Social Informatics, Graduate School of Information Science, Nagoya University

Touch panel display is device that we can operate computer easily. It is especially effective for disabled people who have disability to operate PC with their hands and for who are not familiar with correspondence between movement of mouse and movement of a cursor on the screen. And web browsers we often use are supported to be operated with mouse.

Therefore we propose a web browser for touch panel display which has two features.

1. All buttons in the browser are bigger than usual one so that users can touch the screen easily with their fingertips or pen.
2. When users operate scroll buttons they must be felt as if they turn over the pages.
